

Our adventure at the Playhouse this week...

The children have been creating teeth models to add to our 'Caring for our Teeth' display. Collage creation using different shapes. The large marbel run has been extremley popular.

Next week.

Caring for our teeth and how to keep them healthy and Autumn.

Woodwork hammering and sawing, focusing on our fine motor and hand and eye co-ordination.
 Planting winter vegetables. Sport with Richard on Wednesday.

Bring your library book back to exchange for a new one. With the temperature getting cooler, please remember warmer clothes and definitely a Coat.

Please remember the car park can only be used until 8:00 Am and after 4:00 PM.

Why are button batteries dangerous?

Button batteries are small, round, silver-coloured batteries that come in many different sizes and types. They power many of our devices at home to make our lives more convenient.

Most button batteries pass through the body without a problem. But if a lithium coin cell battery gets stuck in the food pipe, energy from the battery reacts with saliva to create caustic soda. This is the same chemical used to unblock drains!

This can burn through the food pipe, to the main artery and lead to catastrophic internal bleeding and death. The chemical reaction can happen in as little as two hours. However, sometimes it takes days or even weeks.

Lithium coin cell batteries can also cause life-changing injuries. There is a risk that the food pipe is too badly damaged for a child to eat normally against or the vocal cords are too badly damaged for a child to speak normally again.
